

ABSTRACT

The invention relates to a method of addressing a management object in a device management system, wherein at least one management object is added to a manageable client device. The method comprises retrieving a content of a predetermined data element from information in the management object. At least part of the content of said data element is coded using a predetermined coding algorithm. At least part of the content of said data element, in coded form, is assigned as an identifier for the management object. The identifier is used to address the management object.
